

ClinixSummary

AI-POWERED CLINICAL DOCUMENTATION

Better Care Through Advanced Technology

Your clinician uses ClinixSummary — an advanced AI documentation system — to improve the quality of your care. Instead of typing notes during your appointment, your clinician can give you their full attention.

How it works

During your consultation, the system listens to the conversation and converts the audio into text. From that text, a clinical summary is generated for your medical record. Your clinician then reviews and approves the summary before it is added to your record.

The recording can never be played back

The audio is permanently deleted the moment your clinical note is created. It cannot be replayed, retrieved, or accessed by anyone — ever. Your clinician does not hear or see the original recording or the transcription — only the final approved note.

Your information is private and secure

All data is encrypted to the highest standards and processed within a private, secure system. Your consultation data is never shared with third parties or external services.

Your clinician reviews everything

The AI creates a draft note from the conversation. Your clinician always reviews and approves the final document before it becomes part of your medical record.

You are always in control

If you would prefer that the system is not used during your visit, simply let your clinician know. Your care will not be affected in any way.

“This technology exists for one reason — to give your clinician more time to focus on what matters most: you.”

The recording can never be played back
